-------------------------------------	----

WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatisms other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized and total beds occupied.

Unless otherwise specified, beds authorized as shown in this report are defined in par. 36h of AR 40-1080, C 2. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station. Likewise Convalescent Hospitals are denoted by the letters (CH).

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 3 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 25 AUGUST 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 25 August 1944 the admission rate from all causes decreased to 533 per year per thousand strength, which is 4 percent below the rate for the previous week and less than 1 percent above the minimum rate for 1944 registered during the last week of June. Current morbidity thus continues well below the lowest rates reported in 1942 or 1943.

The current week's admission rate from all diseases combined decreased to 464 per thousand, which is 33 percent under that for the corresponding week of 1943.

Morbidity from injury decreased to 69 per thousand and is about 30 percent lower than for the corresponding week of 1943. The current week's admission rate from injury is the lowest reported for any week since May 1944.

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased fractionally to 67 per thousand, which is more than 25 percent under the rate for the corresponding week of 1943. Since the week ending 23 June 1944 the admission rate from these causes has fluctuated between 65 and 68 per thousand; this very low level of morbidity is considerably under the lowest rates experienced in 1942 or 1943.

The admission rate from pneumonia remained at 6 per thousand or about one-third lower than for the corresponding week of 1943. During the past two months morbidity from this cause has been at about the same level each week.

Common Communicable Diseases:

Morbidity from venereal disease, excluding cases contracted prior to entry into active service, increased to 39 per thousand to equal the peak rate for the year reported during the week ending 28 July. Current morbidity from these causes is about 10 percent greater than during the corresponding week of 1943.

The admission rate from diarrhea and dysentery continued at 10 per thousand for the current week, which is more than 50 percent under the rate for the corresponding week of 1943.

The number of new cases of meningitis remained at the relatively low level of 20 new cases per week, or about half the number reported during the corresponding week of 1943. The number of new cases of rheumatic fever decreased further to the lowest level recorded this year (about 75 percent lower than the peak number reported for the week ending 24 March). New cases of poliomyelitis numbered 8 for the current week, which is the highest weekly total reported this year.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

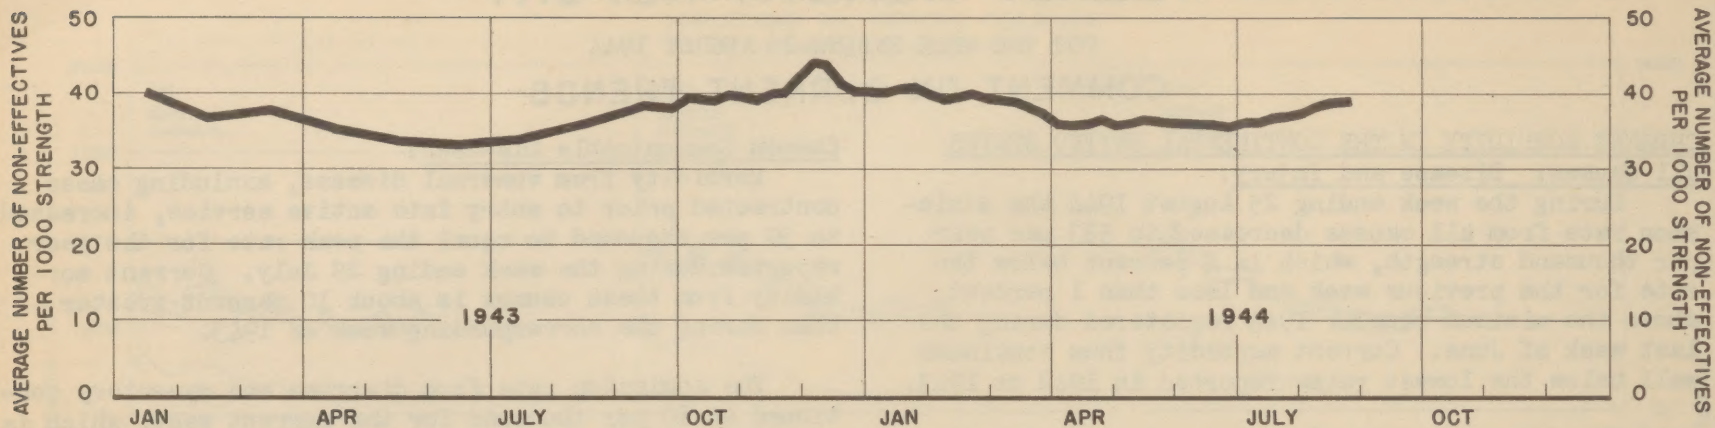

All Causes: Disease and Injury:

The admission rate from disease decreased in all Service Commands except the Sixth where only a slight increase was registered. The largest decreases were recorded in the Second Service Command and the Military District of Washington.

The First Service Command reported the highest morbidity from all causes (608 per thousand) and from disease (547 per thousand). The lowest morbidity from all causes was reported by the Seventh Service Command (500 per thousand), closely followed by the Eighth

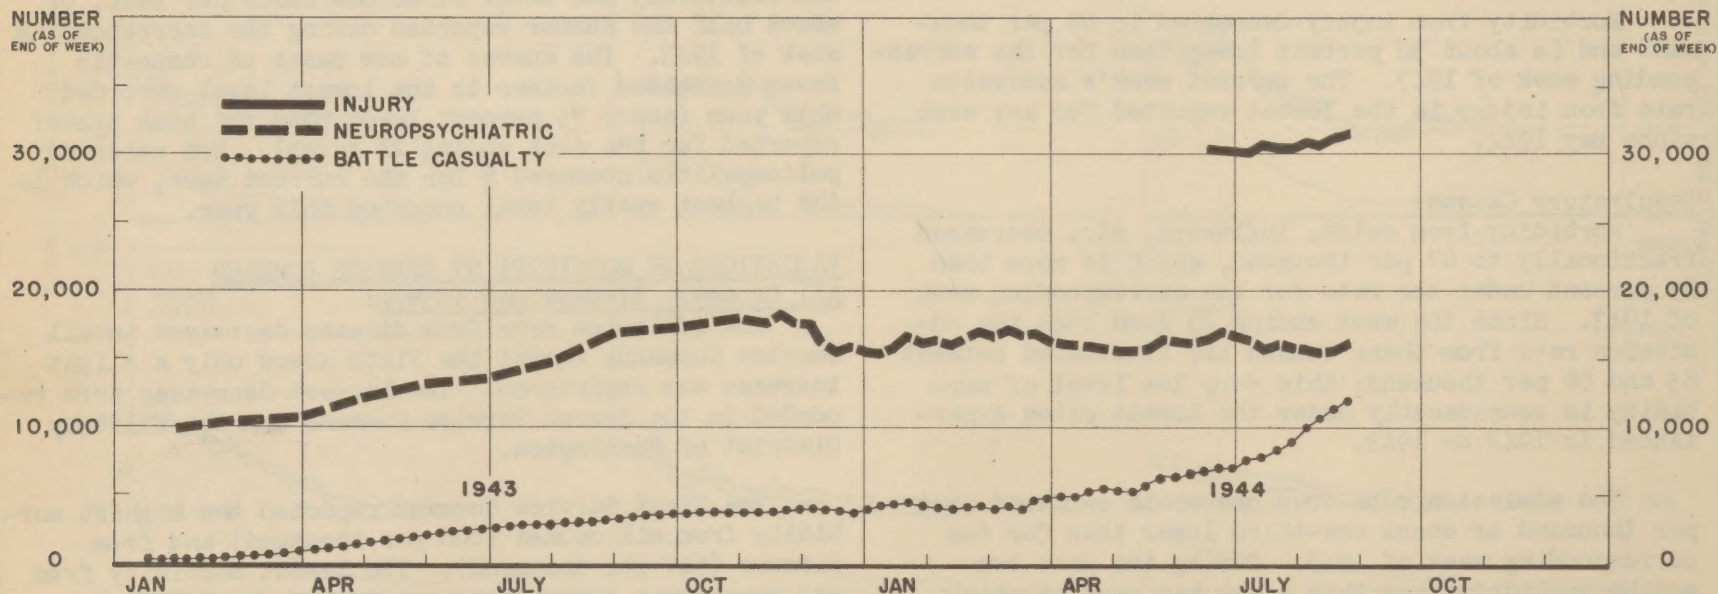

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

Service Command (503 per thousand). The Eighth Service Command reported the lowest morbidity from disease (426 per thousand); this is the fourth consecutive week that this Command has reported the lowest morbidity from disease.

Most of the Service Commands reported lower admission rates from injury, with only small increases being shown for the First and Fourth Service Commands. The largest decreases were registered in the Military District of Washington and the Second, Third, Fifth, and Ninth Service Commands. The Eighth Service Command with a rate of 77 per thousand reported the highest morbidity from this cause, while the Third, Sixth, and Seventh Service Commands and the Military District of Washington with rates of less than 60 per thousand were the lowest.

Respiratory Causes:

Although the admission rate from colds, influenza, etc. for the country as a whole remained at about the same as for the previous week, there were marked changes in morbidity from these causes in some Service Commands. Sharp decreases were recorded by the Second, Third, and Fourth Service Commands, while increases were registered in the Fifth, Sixth, and Eighth Service Commands.

The Second Service Command reported the highest morbidity (96 per thousand) from colds, influenza, etc. despite a sharp decrease from the revised admission rate of 111 per thousand registered the previous week. The Fourth and Seventh Service Commands both with rates of 59 per thousand reported the lowest morbidity from these causes.

The Second Service Command and the Military District of Washington reported sharp decreases in morbidity from pneumonia from the relatively high rates re-

ported the previous week. The Sixth Service Command continued to register morbidity from this cause of about 10 per thousand; this was by far the highest admission rate reported by any Service Command.

Common Communicable Diseases:

Morbidity due to "new" venereal (excluding EPTS) cases increased in all Service Commands, except the First, the Fourth, and the Military District of Washington. In the First Service Command a sizeable decrease was recorded from the very high level of the previous week. Most of the increases were of relatively small magnitude except in the Sixth Service Command where the admission rate rose from 41 per thousand to 61 per thousand; this increase occurred generally throughout the Service Command and of the ten stations with a strength of 5000 or more, 8 experienced higher admission rates. The Fifth and Sixth Service Commands both reported morbidity from these causes of about 60 per thousand. All Service Commands except the Military District of Washington reported admission rates of 35 per thousand or more.

The highest morbidity from diarrhea and dysentery was reported by the Fifth Service Command (14 per thousand); all other Service Commands reported admission rates of about 10 per thousand or less.

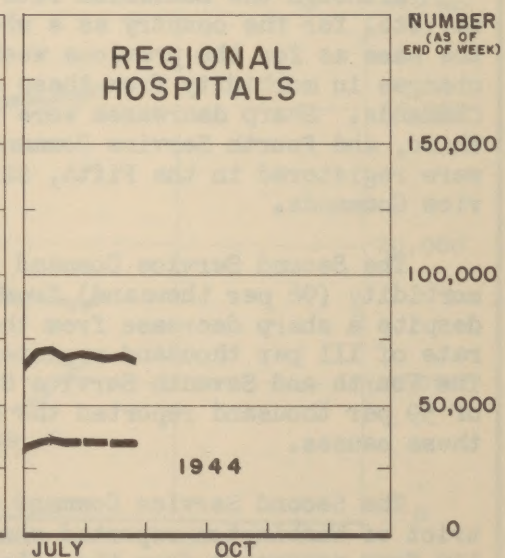

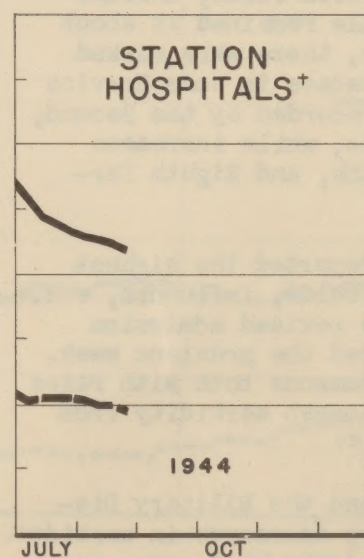

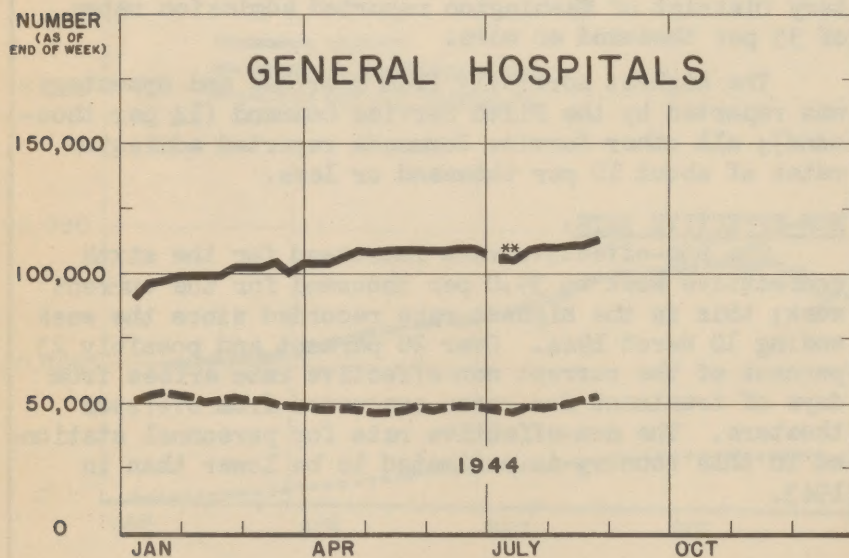

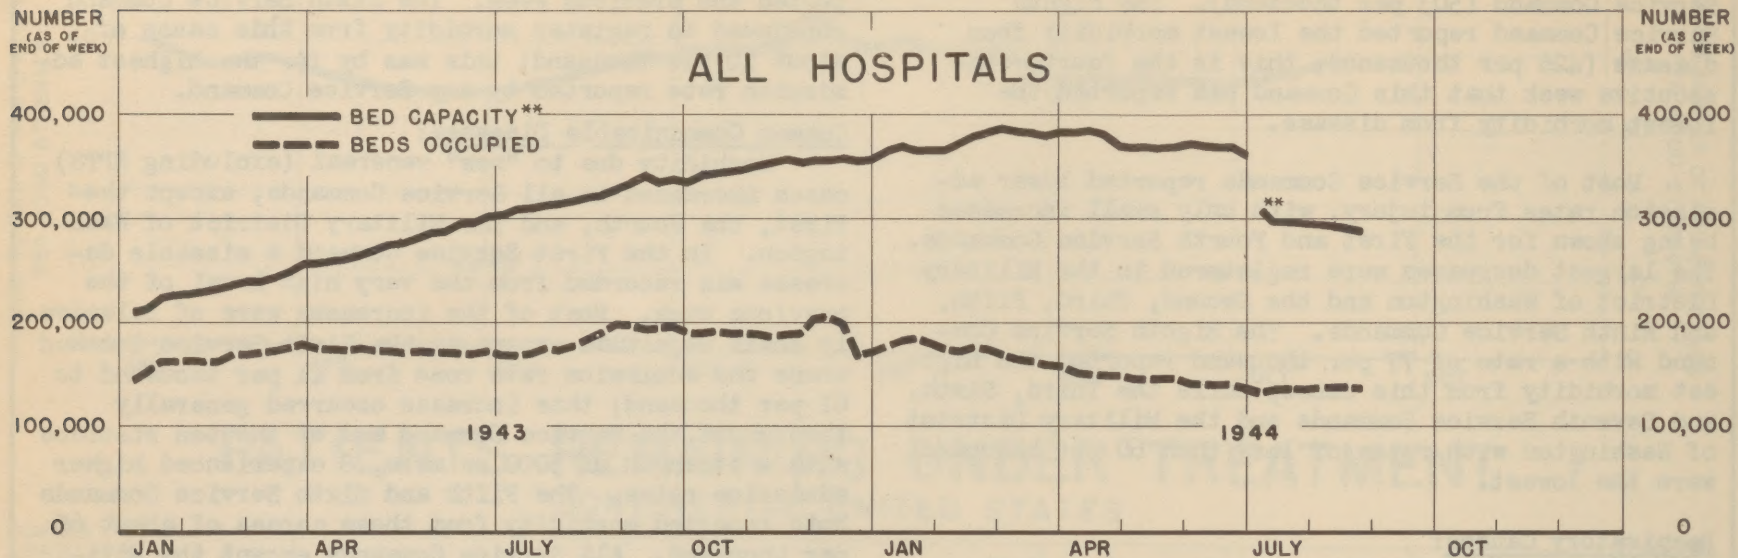

NON-EFFECTIVE RATE:

The non-effective rate increased for the sixth consecutive week to 39.0 per thousand for the current week; this is the highest rate recorded since the week ending 10 March 1944. Over 20 percent and possibly 25 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week represented a rate of 38.6 per thousand strength. The number of neuro-psychiatric cases remaining as of 25 August 1944 was reported at 16,232 or about 650 more than the previous week.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 25 August 1944 totaled about 31,400 or almost 1,400 in excess of the number at the beginning of July. The number of battle casualty patients remaining increased by more than 600 to 12,061; all but 310 of these were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 25 August 1944 the total number of enlisted men discharged by CDD was 3,471 - about 150 more than the previous week and the highest number recorded since such data have been reported (in July and subsequent). More than one-half of these discharges were reported by General Hospitals.

CURRENT HOSPITAL CONDITIONS:

The total authorized beds as of 25 August 1944 numbered about 289,000 or 3,000 less than at the end of the previous week. The total number of beds occupied was 137,000 (or 47 percent of the total beds authorized) which was about 1,000 less than at the end of the previous week. Included in the total authorized beds were 258 T/O hospital beds and tentage, none of which were occupied.

The total authorized beds in General Hospitals numbered 113,279 which was an increase of about 2,200 over the previous week, due principally to the opening of a new General Hospital at Fort Lewis, Wash. The total number of beds occupied in General Hospitals was 52,933 (or 47 percent of the authorized beds) which was about 600 more than at the end of the

previous week.

Station hospitals (as distinct from Regional Hospitals) reported about 109,000 total authorized beds, while Regional Hospitals reported about 67,000 beds. The number of beds occupied at station hospitals was about 48,000 or 44 percent of total authorized beds. The beds occupied at Regional Hospitals numbered about 36,000 or 54 percent of total authorized beds. Eight stations (De Ridder AAB, La., Brookley Field, Ala., Stockton Ordnance Depot, Calif., St. Petersburg C.H., Fla., Santa Ana AAB, Calif., Camp Clark, Mo., Florence PW Camp, Ariz., and Camp Murphy, Fla.) reported more beds occupied than authorized beds; the first five of these were in this same category last week.

Included among the station hospitals are eight which are designated as Convalescent Hospitals (ZI); these reported 3,017 authorized hospital beds (1,671 occupied) and in addition 10,720 beds in convalescent facilities (1,596 occupied).

The bed capacity of convalescent facilities in General Hospitals was 19,410. Mayo G.H. and Letterman G.H. discontinued reporting such facilities, while Dewitt G.H. and Dibble G.H. reported them for the first time. The total beds occupied in such convalescent facilities was 6,583 or 34 percent of the total bed capacity.

The occupants of the 52,933 hospital beds at General Hospitals (excluding beds at convalescent facilities) were as follows: Army (excluding AAF and WAC) - 41,321, AAF-7,128, WAC-500, other U.S. armed forces - 187, allied and neutral armed forces-58, prisoners of war-2,134 and civilians- 1,605.

As of 25 August hospital beds occupied by prisoners of war (including Italian Service Units) totaled 6,143 (3,870 at prisoners of war camps, 2,134 at General Hospitals, and 139 at other stations).

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 28 JULY 1944

VENEREAL DISEASE ADMISSION RATES

This Supplementary Health Report presents a study of venereal disease admission rates by color for all units in the continental United States reporting on Form 86ab. The data cover the four week period ending 28 July 1944 and are shown for individual stations only where the colored male strength was 1000 or more, with the data for all other units being grouped together within each Service Command.

In considering morbidity from venereal diseases during July, reference should be had to the Supplementary Health Report contained in the Weekly Health Report for the week ending 18 August 1944, in which the July venereal disease admission rates for all Army personnel combined are shown for individual stations. On page 38 of that report there are set forth the numbers of cases remaining under treatment at the end of the month, in each Service Command.

The venereal cases remaining under treatment at the end of July accounted for 2.60 percent of all types of cases under treatment. The days lost due to venereal diseases during the four week period ending 28 July 1944 totaled about 90,000 or an average of about 22,500 per week, representing a non-effective rate of .80 per thousand. Of the 90,000 days lost due to venereal diseases, about 40,000 days were attributable to colored males. The resulting non-effective rate from venereal diseases for colored males was 4.1 per thousand, while for all other personnel it was only .49 per thousand.

On pages 41 to 43 there are presented for the first time data on the number of days lost on account of venereal diseases and the resulting non-effective

rates by Service Commands for the first seven months of 1944. For the early months of the year these data have, in part, been estimated. In considering the number of days lost each "month" it should be kept in mind that some of the "months" refer to 5 week periods, whereas others relate to 4 week periods, as noted in the tables; however, the non-effective rates developed are strictly comparable. It is noteworthy that from January through May there was a consistently downward trend in non-effectiveness from venereal disease, despite an increasing trend in admission rates from these causes. Thus in January an average of more than 50,000 days were lost from these causes per week, whereas in May the corresponding figure was slightly less than 25,000 days. The decrease in non-effectiveness was shared by both colored males and the remainder of the Army. In June and July the venereal non-effective rates remained at about the same levels as in May.

In considering the variations in venereal non-effective rates by Service Command, it should be kept in mind that such variations reflect not only differences in non-effectiveness between Service Commands but also to some extent the differences in size of the general hospital facilities in each Service Command. (This is especially true of the Military District of Washington, which has an unusually low venereal rate, but because of the location of Walter Reed G.H. in this Command, reports a relatively high venereal non-effective rate).

For all Army personnel combined the morbidity from venereal diseases (excluding cases contracted prior to entry on active service, designated in this report as

RESTRICTED

VENEREAL DISEASE ADMISSION RATES (CONT'D)

EPTS) was at a rate of 35 per thousand in July or more than 10 percent in excess of the rate of 31 per thousand for June. For colored males the July rate was 151 per thousand, while for all other Army personnel it was only 23 per thousand, both rates being higher than in June. Morbidity of colored male personnel from venereal disease has continued to be about 7 times as high as for other Army personnel.

The July admission rate for syphilis (excluding EPTS cases) among colored males was about 12 times as high as for other Army personnel, whereas for gonorrhea (excluding EPTS cases) the rate for colored males was only 6 times as high. Venereal diseases other than gonorrhea and syphilis (excluding EPTS cases) were practically all reported among the colored males who accounted for about 85 percent of such cases although representing less than 10 percent of the total strength of the Army. The admission rate from such venereal diseases was 12 per thousand for colored males as contrasted with only .2 per thousand for the remainder of the Army.

For all Army personnel combined the morbidity due to venereal EPTS cases, which were predominantly syphilis, was at a rate of 12 per thousand in July, with corresponding figures of 110 and 3 per thousand for colored males and the remainder of the Army, respectively. Variations in the admission rate for venereal EPTS cases reflect entirely the experience among current inductees, so that differences in the incidence of such cases by Service Command or by individual station have little significance. Quite naturally, reception centers report very high rates of admission from venereal EPTS cases, whereas other stations usually show few cases or none at all.

For colored males, the Second Service Command continued to report by far the highest morbidity from

venereal diseases (excluding EPTS cases), as indicated in the chart on page 40. The July rate of 272 per thousand for this Service Command was almost double the July rate among colored males for the country as a whole. The very high morbidity at Camp Kilmer and Camp Shanks, at which are located large numbers of task force troops not under the jurisdiction of the Second Service Command, was in large part responsible for the high rate of this Command. The next highest morbidity for colored troops (213 per thousand) was reported by the Fifth Service Command. The First and Seventh Service Commands and the Military District of Washington, with rates of less than 120 per thousand reported the lowest morbidity from these causes among colored males.

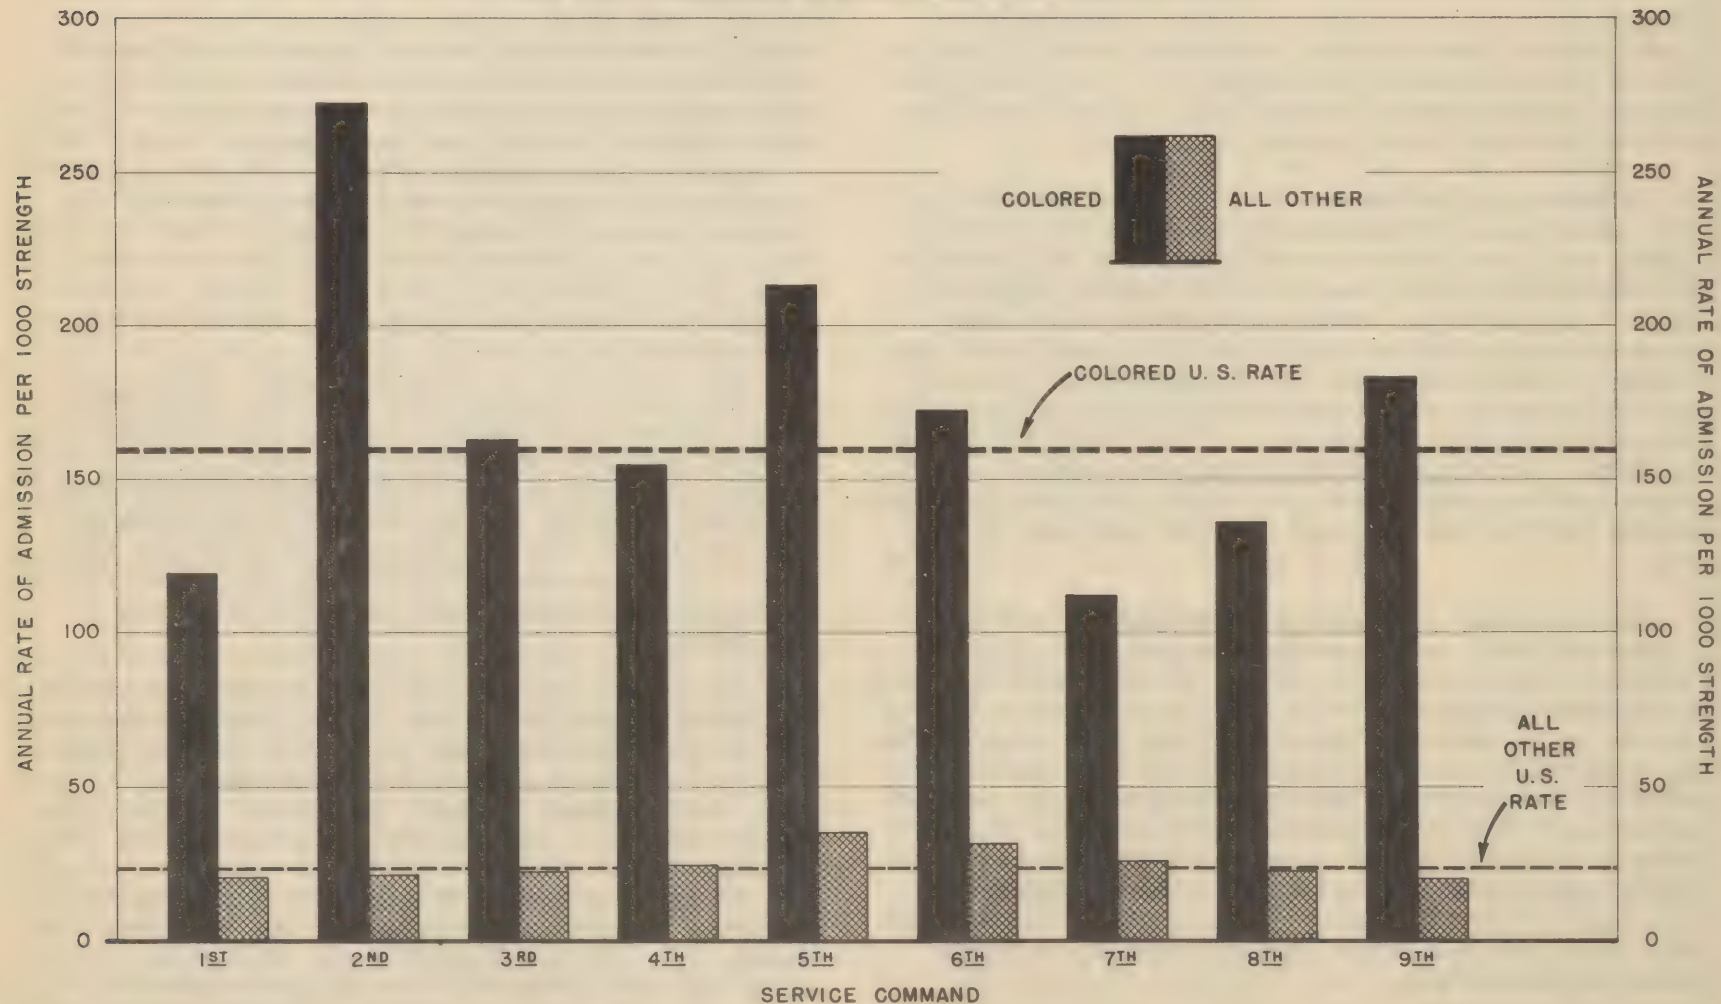

For other Army personnel there was relatively little variation by Service Command in morbidity from venereal diseases (excluding EPTS cases). The Fifth and Sixth Service Commands both had rates in excess of 30 per thousand, but all other Service Commands had morbidity within the range of 20 to 25 per thousand. As in previous months the Military District of Washington experienced relatively low morbidity (9 per thousand).

For colored males the following stations reported admission rates in excess of 300 per thousand from all venereal diseases (excluding EPTS cases): Camp Kilmer, N.J., Camp Shanks, N.Y., Greensboro AAFORD, N.C., Herbert Smart Airport, Ga., Camp Campbell, Ky., Ft. Lawton, Wash., Los Angeles PoE, Calif., and Camp Stoneman, Calif.

The highest admission rates for syphilis (excluding EPTS) among colored males were reported from Camp Shanks, N.Y. (87 per thousand) and Los Angeles PoE, Calif. (72 per thousand). The highest rates for colored troops from "other" venereal diseases (excluding EPTS) were at Camp Kilmer, N.J. (46 per thousand) and Camp McCain, Miss. (45 per thousand).

VENEREAL DISEASE (EXCLUDING EPTS CASES) ADMISSION RATES BY SERVICE COMMAND

SUPPLEMENTARY HEALTH REPORT

FOR THE CALENDAR MONTH OF JULY 1944

ANALYSIS OF INJURIES

NATURE OF THE DATA:

The data regarding injuries to military personnel presented here are based on reports rendered in accordance with the provisions of WD Circular No. 252, 20 June 1944. The first reports were required for the calendar month of July but because the directive was tardy in reaching some installations and because the reporting system inaugurated was new, many stations did not submit reports, and a large proportion of the reports submitted were incorrect or incomplete. It is anticipated that this situation will be largely remedied with respect to the August reports.

The reports cover all military personnel at Class I, II, and IV installations with a military strength of 25 or more. AAF personnel at such installations are included, but all personnel of Class III installations regardless of arm or service are excluded since they are covered by the separate reporting system of the AAF. The reports deal with admissions for injury for each calendar month; the terms "admission" and "injury" are used as in the Statistical Health Report, WD MD Form 86ab (see Nature of the Data on page 2 of this report).

For purposes of reporting, military personnel are classified according to whether or not attached for medical care to the reporting medical installation. Injuries are classified primarily as to whether they were sustained on duty or off duty (i.e. on leave, pass, furlough, or AWOL). Injuries are further classified according to type of injury, nature of activity, causative agent, and unsafe condition or act.

In general, the analysis of injuries is confined to injuries sustained while on duty and to military

personnel attached for medical care to the reporting installations, because only such injuries are subject to effective control by military authorities. Since the frequency of particular types of injuries depends to a large extent on the nature of the activities carried on within the Service Command or station, no definite conclusions may be drawn from differences in rates (or percentage distributions of injuries) by type of injury, causative agent, etc. unless the nature and the extent of particular forms of activity are also taken into account.

ANALYSIS OF THE DATA:

Because of the incompleteness of the data, previously mentioned, the following analysis will deal only with percentage distributions and relative comparisons rather than with actual numbers of admissions or admission rates. The data included in the analysis covers about 75 percent of the total strength of the installations from which reports should have been received. As shown by the chart on page 49, the admission rate from injury at the installations covered by these reports decreased from about 100 per thousand strength per year in July and August 1943 to a level of about 70 per thousand from December 1943 to May 1944 but has since increased slightly.

Analysis of Admissions by Duty Status:

In respect to personnel attached for medical care to the reporting installation 87 percent of the injury admissions were sustained on duty. On the other hand, for unattached personnel only about 40 percent were sustained on duty. For both attached and unattached personnel combined, off duty injuries accounted for 15 percent of all injury admissions. The admissions for attached personnel represented 93 percent of all

ANALYSIS OF INJURIES (CONT'D)

injury admissions (irrespective of duty status).

Analysis of Deaths by Duty Status:

For attached personnel about 70 percent of the deaths were on duty, while among the unattached personnel the corresponding proportion was only about 50 percent. Of the total deaths (irrespective of duty status) about 80 percent were among attached personnel. With the on duty deaths of attached personnel were included 14 suicides; these accounted for about 20 percent of all such deaths.

Analysis of Admissions by Type of Injury:

Almost 75 percent of the on duty injuries among attached personnel were represented by wounds, fractures, or sprains (including strains and over-exertion) with an almost equal proportion of cases falling into each of these three categories (see table on page 50). As would be expected, most of the admissions for reaction to drug, serum, or anesthetic (2 percent of the total admissions) were reactions to immunization and occurred at reception centers and staging areas. There was relatively little difference between Service Commands for the various categories except for injuries due to the effects of heat, of which the great majority were reported by the Fourth and Eighth Service Commands, as might have been anticipated.

Analysis of Admissions by Nature of Activity:

About 85 percent of the on duty injuries among attached personnel occurred while engaged in scheduled activities. The greatest number occurred on work details accounting for 17 percent of all on duty injuries, followed by field problems (13 percent), drills or marches (11 percent), and supervised athletics (10 percent).

Analysis of Admissions by Causative Agent:

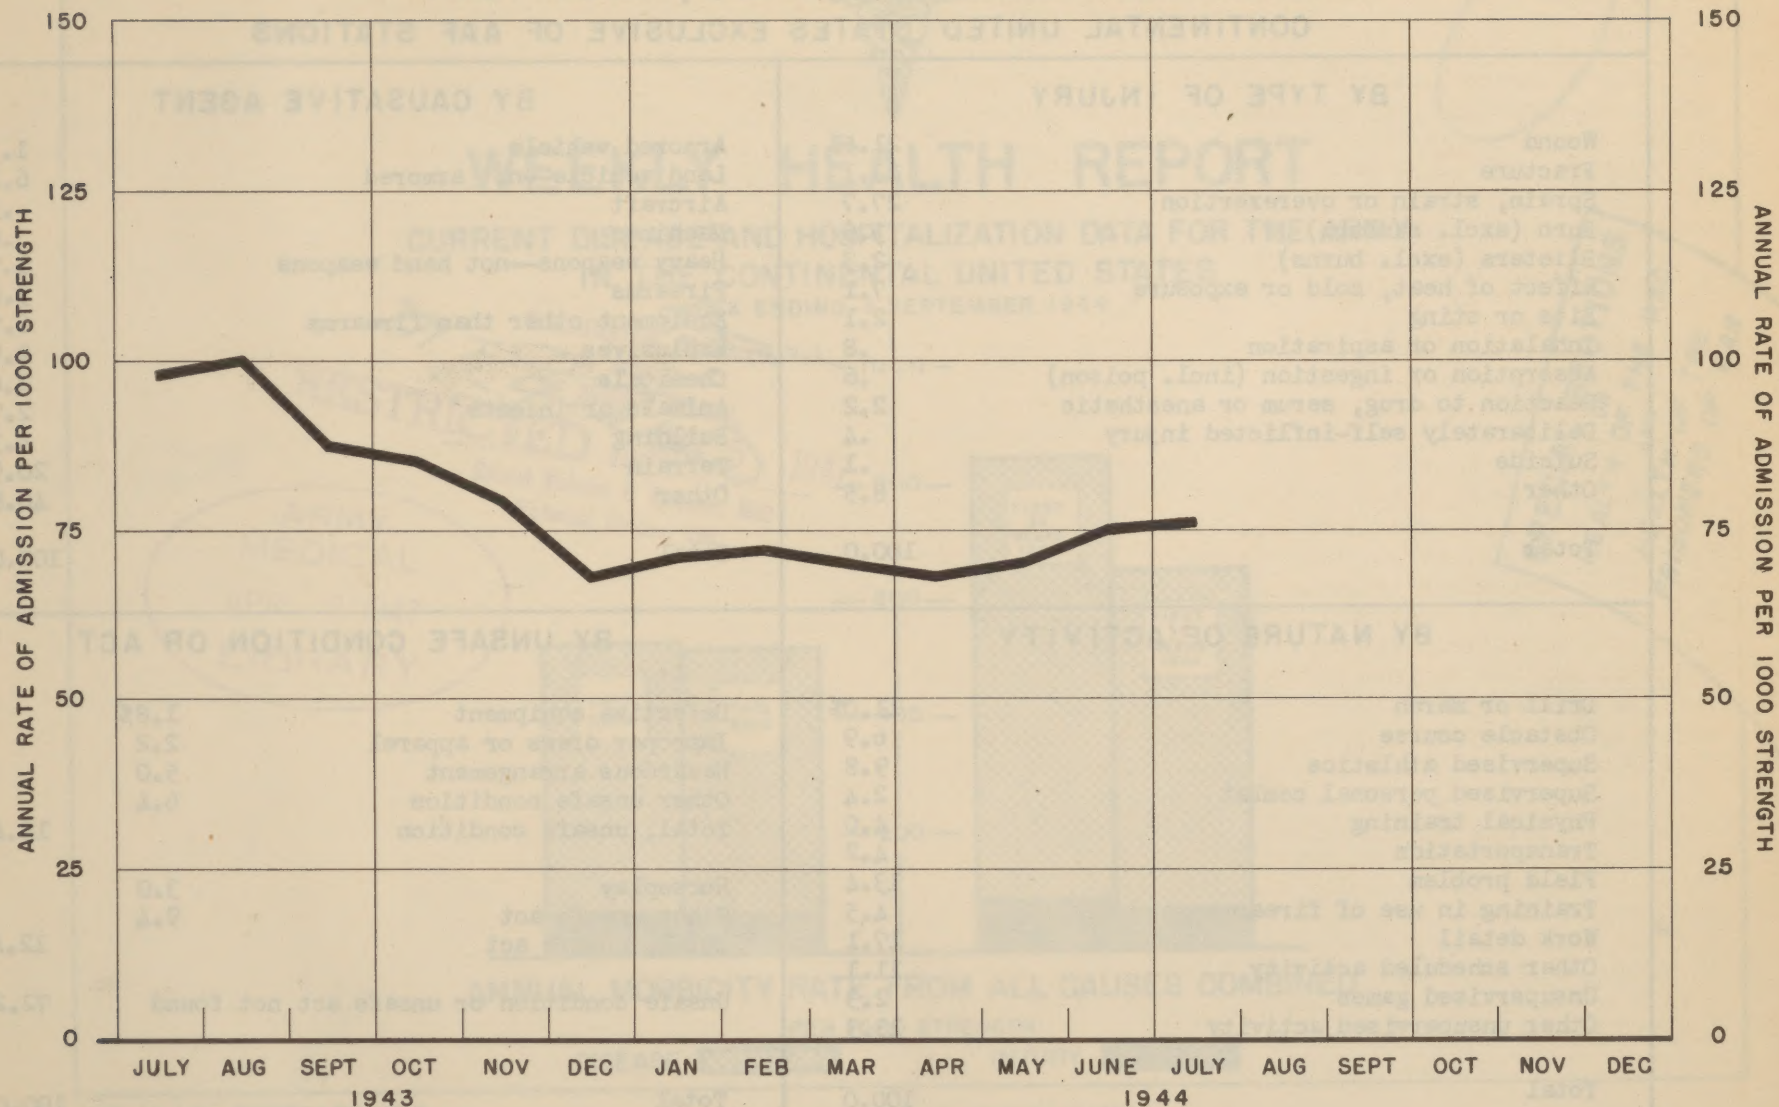

Almost 50 percent of the on duty injuries among attached personnel were caused by agents other than those specifically listed in the report. The only causative agent showing a relatively large proportion was terrain (21 percent). Admissions from land vehicles, not armored (i.e. chiefly automobiles and trucks) accounted for only 6 percent of the total admissions. The relatively low proportion of aircraft injuries was to be expected because of the exclusion of most AAF personnel from the reporting system.

Analysis of Admissions by Unsafe Condition or Act:

In almost 75 percent of the on duty injuries among attached personnel no unsafe condition or unsafe act was reported to have been found. Of the remaining cases about half were reported to be due to unsafe conditions and about half due to unsafe acts.
